# Expense Tracker System

## Project Title
Expense Tracker System - Python Mini Project

## Description
The Expense Tracker System is a menu-driven Python console application
designed to help users record, view, and manage daily expenses. The
project is developed as part of a Python Mini Project assignment and
strictly follows the guidelines provided in the assignment document.

## Features
- Add a new expense (amount, category, note)
- View all recorded expenses
- Search expenses by category
- Save expenses to a file
- Load expenses from a file
- Menu-driven interface with continuous execution until exit

## Concepts Used
- Python Lists
- Python Dictionaries
- Functions (user-defined)
- Conditional Statements (if / elif / else)
- Loops (while loop)
- String Methods (`strip()`, `title()`, `split()`)
- List Methods (`append()`, `clear()`, `enumerate()`)
- Dictionary Methods (`get()`, `keys()`)
- Exception Handling (`try` / `except`)
- File Handling (`with open()`)

## Instructions to Run the Program
1. Open the `expense_tracker_assignment.ipynb` file in Jupyter Notebook
or JupyterLab.
2. Run all cells in sequence.
3. The menu will appear in the output cell.
4. Enter the appropriate menu number to perform operations.

## Input Guidelines
- Amount should be entered as a numeric value.
- Category should be entered as text (e.g., Food, Travel).
- Notes can be any short description related to the expense.
- Menu choices should be entered as numbers only.

## File Handling Details
- Expenses are saved in a text file named `expenses.txt`.
- Each expense is stored in the format:
    ```
 amount,category,note
    ```
- The program can load previously saved expenses from the same file.

## Sample Menu
1. Add Expense
2. View Expenses
3. Search Expense
4. Save
5. Load

```

6. Exit

Author Information

- Name: Ujwal HB
- Course/Class: MBA 3rd Sem 'B' Sec
- Subject: AI&ML in Finance(Python Programming)
- Institution:B.N.M. INSTITUTE OF TECHNOLOGY
- Academic Year: 2025-2026

This project is developed for academic purposes in partial fulfillment of the Python Mini Project requirements.

```
print('Expenses saved to file')

[6]: def load_from_file():
    try:
        with open(filename, 'r') as f:
            expenses.clear()
            for line in f:
                amt, cat, note = line.strip().split(',')
                expenses.append({'amount': float(amt), 'category': cat, 'note': note})
            print('Expenses loaded from file')
    except FileNotFoundError:
        print('No saved file found')

[7]: def menu():
    while True:
        print('\n1.Add Expense\n2.View Expenses\n3.Search Expense\n4.Save\n5.Load\n6.Exit')
        choice = input('Enter choice: ')
        if choice == '1':
            add_expense()
        elif choice == '2':
            view_expenses()
        elif choice == '3':
            search_expense()
        elif choice == '4':
            save_to_file()
        elif choice == '5':
            load_from_file()
        elif choice == '6':
            print('Exiting program')
            break
        else:
            print('Invalid choice')

[8]: add_expense()
Enter amount: 20000
Enter category: Fees
Enter note: 3 rd sem fees
Expense added successfully

[9]: add_expense()
Enter amount: 250
Enter category: dinner
Enter note: dinner in hotel
Expense added successfully
